Подчеркиваются основные принципы формирования генеалогической культуры старшеклассников в целостной образовательной среде семьи и школы: принцип сохранения преемственности поколений, предполагающий формирование сознания старшеклассника, духовных и нравственных ценностей семьи, ветви рода и рода в целом.

Ключевые слова: генеалогия, род, генеалогическая древо, восходящий родословия, нисходящий родословия, закон родословного счета, анализ родословной, аутосомно-доминантное наследование, аутосомно-рецессивное наследование, наследование сцепленных с полом.

One of the most important issues raised from the very first days of our independence to the level of state policy was the rebuilding of the great, invaluable spiritual and cultural heritage created by our ancestors for centuries.

The revival of spiritual values is a process of national self-consciousness, the spiritual resources of the nation, and its return to its roots. Cultural heritage of the people, its spiritual heritage for thousands of years served as a powerful source of spirituality for the people of the East. Despite long ideological pressure, the people of Uzbekistan managed to preserve their historical and cultural values and traditions, which were preserved from generation to generation. Everyone is from where they came from who are their ancestors is interested in knowing Responding to this question will help you to generate Genealogy for accurate collection and grouping of relevant information [1].

Genealogy (Greek genealogy - pedigree, genealogy) is an auxiliary science that studies the origin, ancestry, origin and family relationships. Great people, well-known poets, artisans, artists and their descendants, our contemporaries, are proud of their belongings to ancient generations, and can tell about their ancestral writings, the history of their families [2].

In fact, everyone can say that he originated from the ancient race, and he is right because every seed is ancient and continues its history from the depths of the ages. But not all can verify this with their own line charts or lists. In the past, only nobles were able to record family relationships, and that was a great need for them. Everyone who is interested in family history today is involved in genealogy. This workshop is not only interesting, but also helps cognitive education. The history of the family remains a part of the common history of the country and the person who creates the ancestral calendar understands the history. Familiarity with family history can be helpful in identifying the origin of family memorabilia, as well as explaining the mystery of family traditions, learning of the people described in the aging photograph of the family album in the early centuries. Alternatively, genealogy influences the formation of the moral and ethical outlook of young people. "Genealogy, the shrub is a powerful moral tool both for strengthening the family and strengthening the state".

Strengthening the activities of the field affects the spiritual well-being of young people, influences their development and finding their place in life, not only the psychological environment of the trained team

"Family - educational institution" also improves relations.

The genealogical method is analyzed on the basis of genetic code in genetics and biology in human beings. Shagara is a scheme that reflects family relationships. By analyzing the rocks it is studied the normal or (usually) pathological symptom of the human race.

Physicians who are currently carrying out medical and genetic counseling believe that all parents who want their children to have no hereditary diseases should learn their genes and analyze it [3].

A big issue is marriage planning. When it comes to genetically-acquired genetic predisposition, it is possible to prevent disease from its very early age. It's just too simple to understand that if your ancestors have a heart attack because of the fact that they have died in the past, you should plan correctly the prevention of the disease. It is always easier to avoid problems.

Most young people choose life choices and choose their future career they will experience a rather complicated period. This is a big problem for the family as well. Based on the experience of your ancestors and their descendants, you can choose your own way of life by analyzing the success or failure of its representatives in one or another area. Quite unnecessary "The choice of parenting profession will not be less". There are many other benefits that make this work invaluable.

The above information can help you to analyze its biological and medical consequences. It should be born in mind that each person must have the skills and qualifications to create the tree, because his family can not form the family of the strangers. In addition, a family member does not disclose their secretions or ailments. Understanding the skill of developing a hierarchy is the ability to teach the students in the various subjects, including the first concepts in the field of classroom studies in primary school classes and the ability and skills of higher education in history, biology and geomorphology. Teaching methods should be developed to give knowledge about hiring. Such knowledge can be used in extracurricular activities, in educational hours.
